Rock Properties

The Theory

Defining MSE

Energy required to destroy a unit volume of rock.

$$MSE = \frac{480 \times T \times RPM}{d_{bit}^2 \times ROP} + \frac{4 \times WOB}{\pi d_{bit}^2}$$

| | |
|------|---------------------------------|
| T | Torque, ft.lb |
| WOB | weight on bit, lbf |
| ROP | rate of penetration, ft/hr |
| RPM | revolutions per minute, min-1 |
| Dbit | Bit diameter, inches |
| MSE | mechanical specific energy, psi |

Using MSE to Calculate Rock Properties

MSE to UCS

$$UCS = MSE \times D_{eff}$$

MSE to PorePressure

$$\frac{P_p}{D} = \frac{OB}{D} - \left[\frac{OB}{D} - \left(\frac{P_p}{D} \right)_N \right] \left(\frac{MSE_o}{MSE_N} \right)^n$$

UCS to CCS

$$CCS = UCS + \Delta p \left(\frac{1 + \sin \theta}{1 - \sin \theta} \right)$$

Using MSE to Calculate Rock Properties

UCS to Porosity

$$\phi = k_1 \times UCS^{(-k_2)}$$

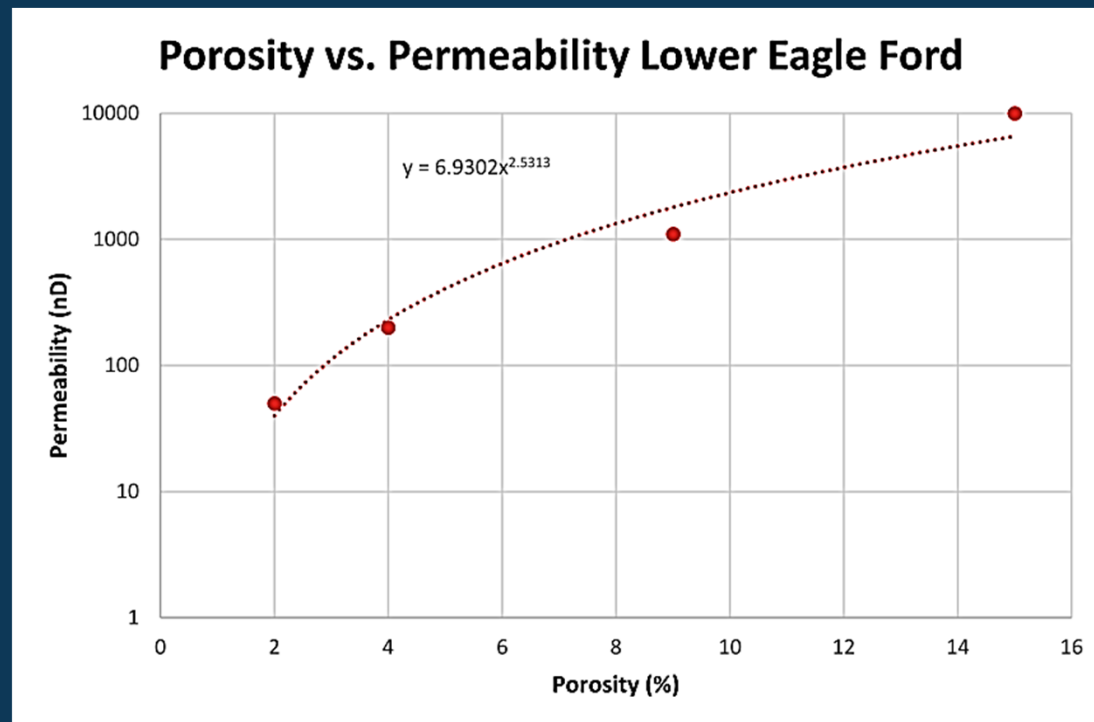

CCS to Young's Modulus

$$E = CCS \times a_E \times (1 + P_c)^{b_E}$$

Permeability & Porosity Correlation

$$K_p = k_3 + \phi^{k_4}$$
